

OOPS Through Java Lab Manual

List of Experiments

1. Lab No 1: Basic Programs in JAVA
2. Lab No 2: Programming Assignments on Arrays and Strings
3. Lab No 3: Programming Assignments on Classes, Objects and Encapsulation
4. Lab No 4: Implementing the concepts of Inheritance and Array Objects
5. Lab No 5: Implementing the OOPS Concepts of Abstract, Interfaces and Polymorphism
6. Lab No. 6: Programming Assignments on File Handling
7. Lab No. 7: Programming Exercises on Exception Handling
8. Lab No 8: Working with List Operations
9. Lab No 9: Implementing the concepts of Multi-Threading
10. Lab No 10: Programming Exercises on Event Handling,

1. Lab No 1: Basic Programs in JAVA

1. Write a java program that takes user input as a number and check whether the number is odd or even.

Algorithm

Step 1- Start

Step 2- Read / input the number.

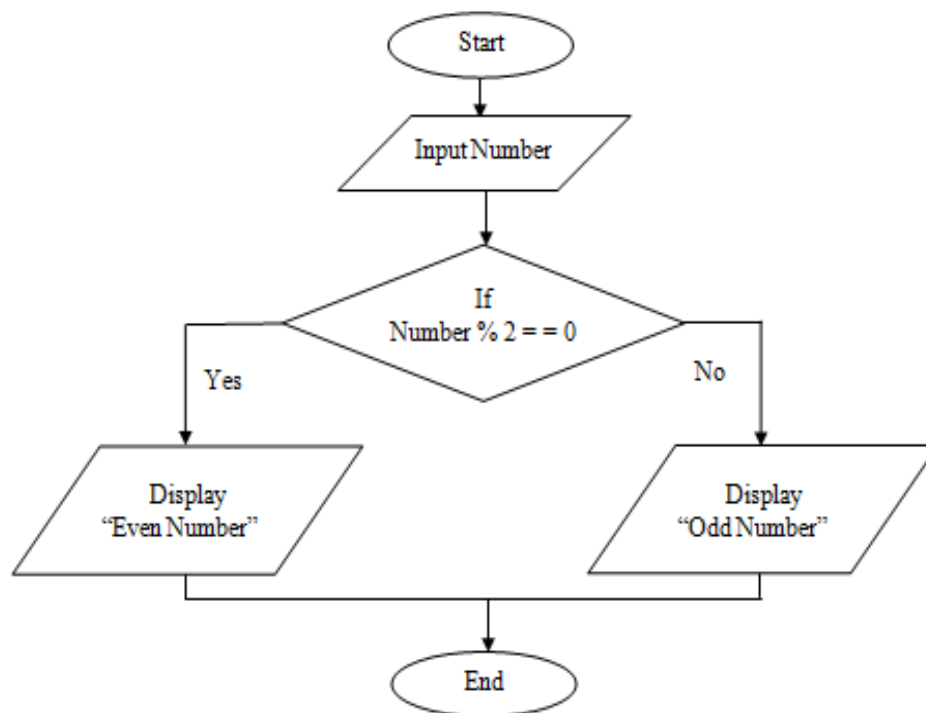

Step 3- if $n \% 2 == 0$ then number is even.

Step 4- else number is odd.

Step 5- display the output.

Step 6- Stop

Flowchart

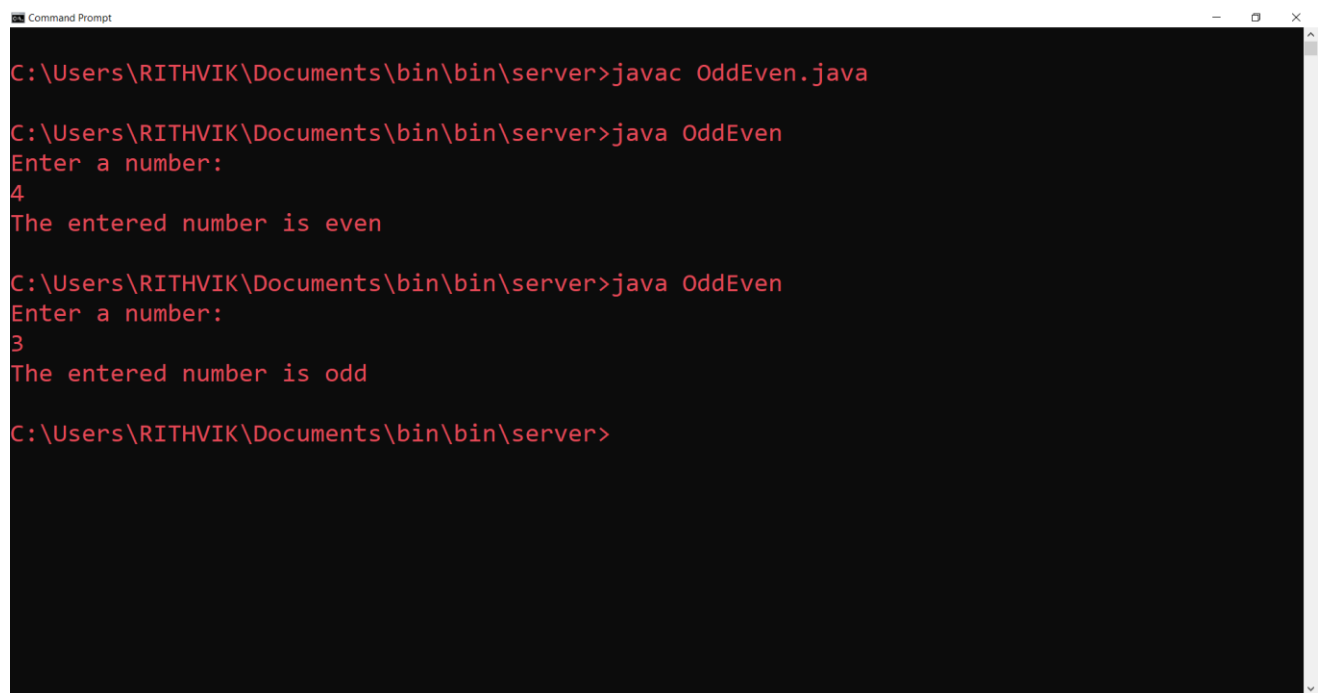

Program

```
import java.util.Scanner;
public class OddEven
{
    public static void main(String args[])
    {
        //To take input from the user
        //Create an object of scanner class
        Scanner input = new Scanner(System.in);
        int num; //Declare a variable
        System.out.println("Enter a number:");
        num = input.nextInt();

        //If number is divisible by 2 then it's an even number
        //else odd number
        if ( num % 2 == 0 )
            System.out.println("The entered number is even");
        else
            System.out.println("The entered number is odd");
    }
}
```

Output

```
Command Prompt
C:\Users\RITHVIK\Documents\bin\bin\server>javac OddEven.java

C:\Users\RITHVIK\Documents\bin\bin\server>java OddEven
Enter a number:
4
The entered number is even

C:\Users\RITHVIK\Documents\bin\bin\server>java OddEven
Enter a number:
3
The entered number is odd

C:\Users\RITHVIK\Documents\bin\bin\server>
```

2. Write a java program that takes user input as a String and check whether the string is a palindrome or not.

Algorithm

Step 1. Start

Step 2. Read the string from the user

Step 3. Calculate the length of the string

Step 4. Initialize rev = "" [empty string]

Step 5. Initialize i = length - 1

Step 6. Repeat until i >= 0:

6.1: rev = rev + Character at position 'i' of the string

6.2: i = i - 1

Step 7. If string == rev:

7.1: Print "Given string is palindrome"

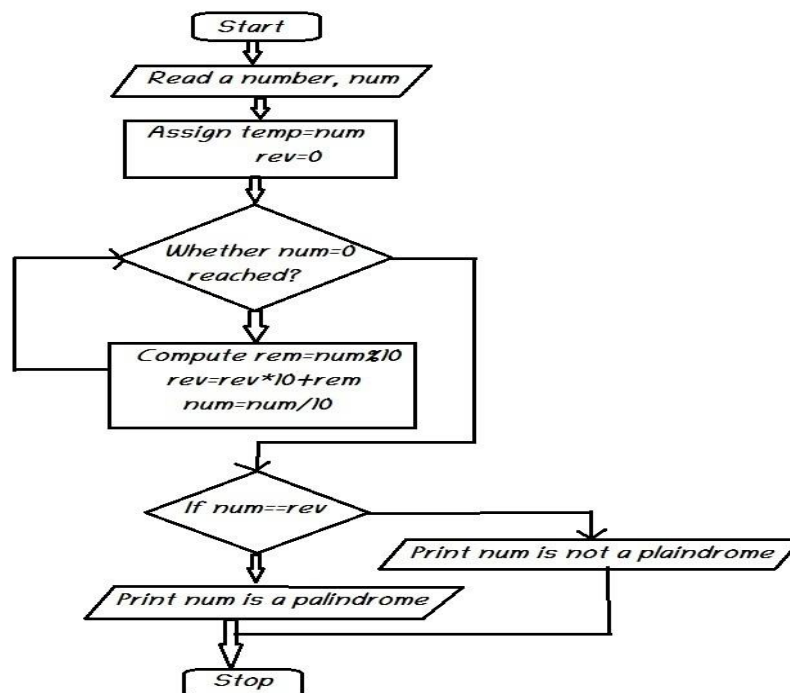

Step 8. Else:

8.1: Print "Given string is not palindrome"

Step 9. Stop

Flowchart

Program to check whether a number is palindrome or not.

Program

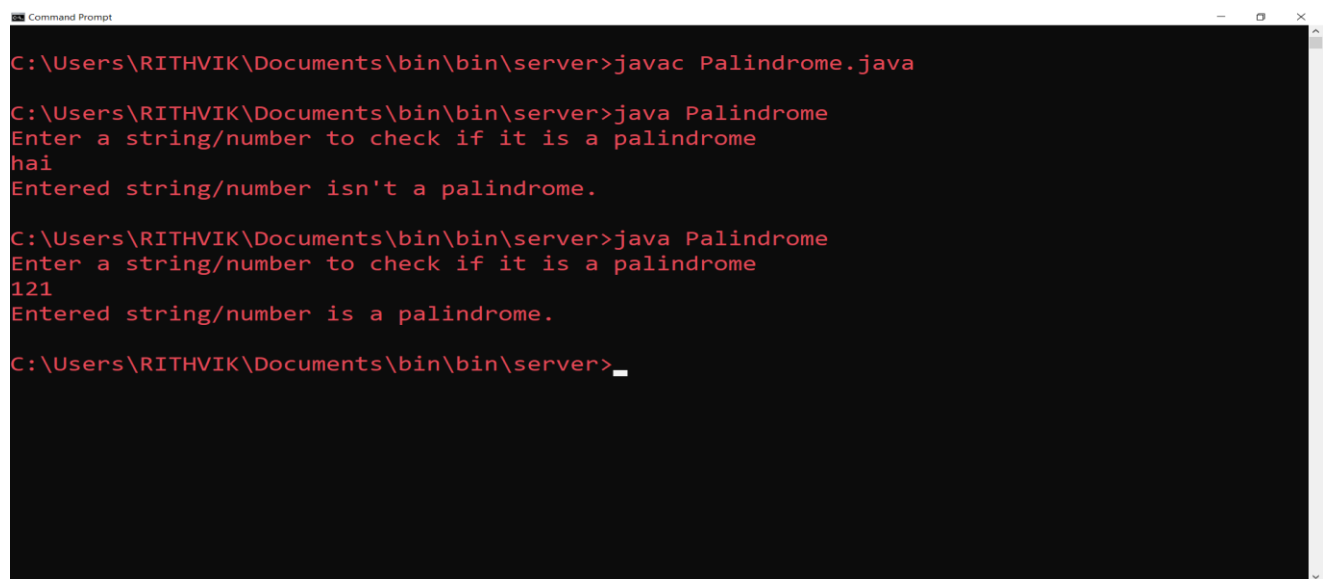

```
import java.util.*;

class Palindrome
{
    public static void main(String args[])
    {
        String original, reverse = ""; // Objects of String class

        Scanner in = new Scanner(System.in);

        System.out.println("Enter a string/number to check if it is a palindrome");
        original = in.nextLine();
        int length = original.length();
        for ( int i = length - 1; i >= 0; i-- )
            reverse = reverse + original.charAt(i);
        if (original.equals(reverse))
            System.out.println("Entered string/number is a palindrome.");
        else
            System.out.println("Entered string/number isn't a palindrome.");
    }
}
```

Output

```
Command Prompt
C:\Users\RITHVIK\Documents\bin\bin\server>javac Palindrome.java

C:\Users\RITHVIK\Documents\bin\bin\server>java Palindrome
Enter a string/number to check if it is a palindrome
hai
Entered string/number isn't a palindrome.

C:\Users\RITHVIK\Documents\bin\bin\server>java Palindrome
Enter a string/number to check if it is a palindrome
121
Entered string/number is a palindrome.

C:\Users\RITHVIK\Documents\bin\bin\server>_
```

3. Write a java program that takes user input as a number and find the factorial of a number.

Algorithm

Step 1: Start

Step 2: Declare Variable n, fact, i

Step 3: Read number from User

Step 4: Initialize Variable fact=1 and i=1

Step 5: Repeat Until $i \leq \text{number}$

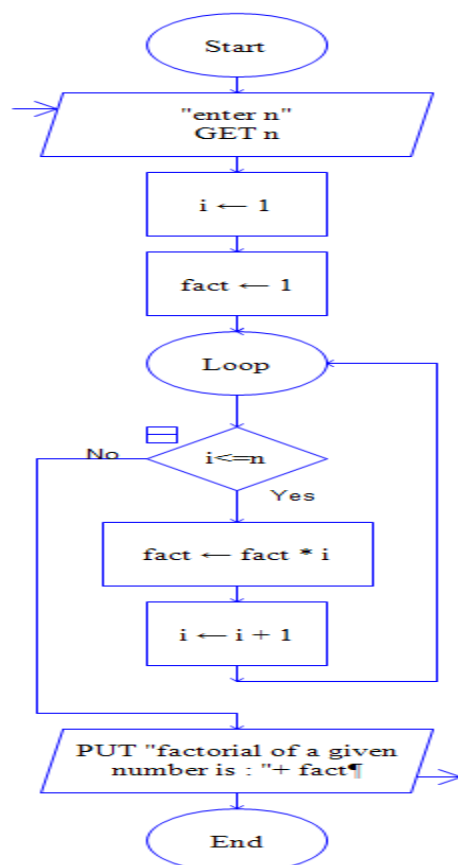

5.1 $\text{fact} = \text{fact} * i$

5.2 $i = i + 1$

Step 6: Print fact

Step 7: Stop

Flowchart

Program

```
import java.util.Scanner;

public class Factorial {

    public static void main(String[] args) {

        //We will find the factorial of this number

        int number;

        System.out.println("Enter the number: ");

        Scanner scanner = new Scanner(System.in);

        number = scanner.nextInt();

        scanner.close();

        long fact = 1;

        int i = 1;

        while(i<=number)

        {

            fact = fact * i;

            i++;

        }

        System.out.println("Factorial of "+number+" is: "+fact);

    }

}
```

Output

```
Command Prompt
C:\Users\RITHVIK\Documents\bin\bin\server>javac Factorial.java
C:\Users\RITHVIK\Documents\bin\bin\server>java Factorial
Enter the number:
5
Factorial of 5 is: 120
C:\Users\RITHVIK\Documents\bin\bin\server>
```

4. Write a java program that takes user input as a number and find whether the number is an Armstrong number or not.

Algorithm

Step 1: Start

Step 2: Declare Variable sum, temp, num

Step 3: Read num from User

Step 4: Initialize Variable sum=0 and temp=num

Step 5: Repeat Until num>=0

5.1 sum=sum + cube of last digit i.e $[(\text{num} \% 10) * (\text{num} \% 10) * (\text{num} \% 10)]$

5.2 num=num/10

Step 6: IF sum==temp

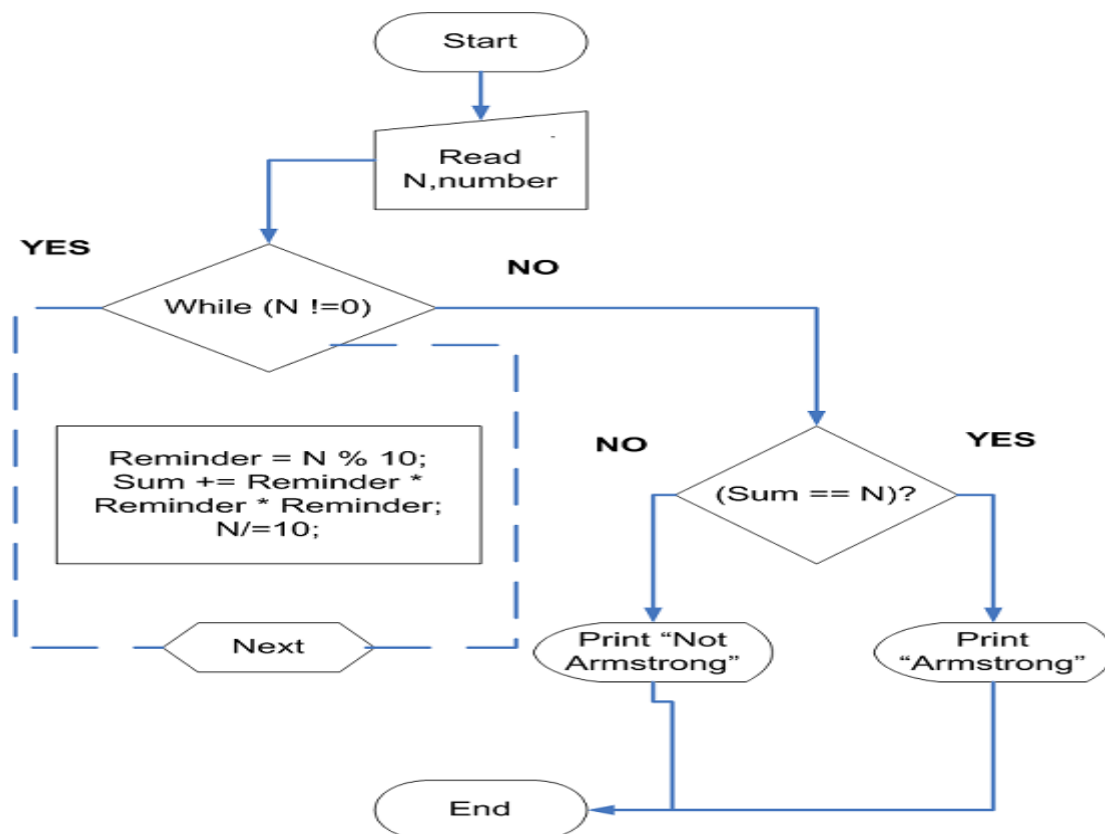

Print "Armstrong Number"

ELSE

Print "Not Armstrong Number"

Step 7: Stop

Flowchart

Program

```
import java.util.Scanner;
import java.lang.Math;
public class Armstrstrong
{
    //function to check if the number is Armstrong or not
    static boolean isArmstrong(int n)
    {
        int temp, digits=0, last=0, sum=0;
        //assigning n into a temp variable
        temp=n;
        //loop execute until the condition becomes false
        while(temp>0)
        {
            temp = temp/10;
            digits++;
        }
        temp = n;
        while(temp>0)
        {
            //determines the last digit from the number
            last = temp % 10;
            //calculates the power of a number up to digit times and add the resultant to the sum variable
            sum += (Math.pow(last, digits));
            //removes the last digit
            temp = temp/10;
        }
        //compares the sum with n
        if(n==sum)
            //returns if sum and n are equal
```

```
return true;

//returns false if sum and n are not equal

else return false;

}

//driver code

public static void main(String args[])

{

int num;

Scanner sc= new Scanner(System.in);

System.out.print("Enter the number: ");

//reads the limit from the user

num=sc.nextInt();

if(isArmstrong(num))

{

System.out.print("Armstrong ");

}

else

{

System.out.print("Not Armstrong ");

}

}

}
```

Output

```
Command Prompt
C:\Users\RITHVIK\Documents\bin\bin\server>javac Armstrong.java
C:\Users\RITHVIK\Documents\bin\bin\server>java Armstrong
Enter the number: 5
Armstrong
C:\Users\RITHVIK\Documents\bin\bin\server>java Armstrong
Enter the number: 236
Not Armstrong
C:\Users\RITHVIK\Documents\bin\bin\server>
```

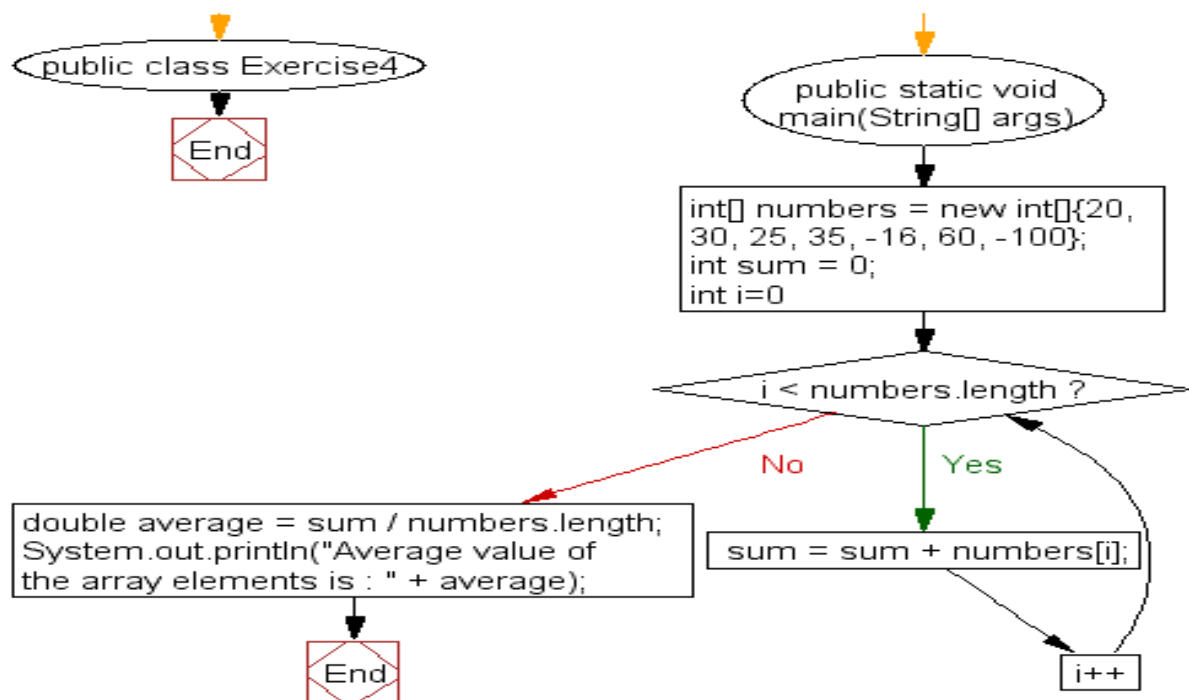

Lab No 2: Programming Assignments on Arrays and Strings

1. Write a java program to calculate the average value of array elements

Algorithm to find average of all array elements

- Let inputArray is an integer array having N elements.
- Declare an integer variable 'sum' and initialize it to 0. We will use 'sum' variable to store **total sum of elements of array**.
- Using for loop, we will traverse inputArray from array from index 0 to N-1.
- For any index i ($0 \leq i \leq N-1$), add the value of element at index i to sum.
 $\text{sum} = \text{sum} + \text{inputArray}[i];$
- After termination of for loop, sum will contain the **total sum of all array elements**.
- Now calculate average as : $\text{Average} = \text{sum}/N;$

Flowchart

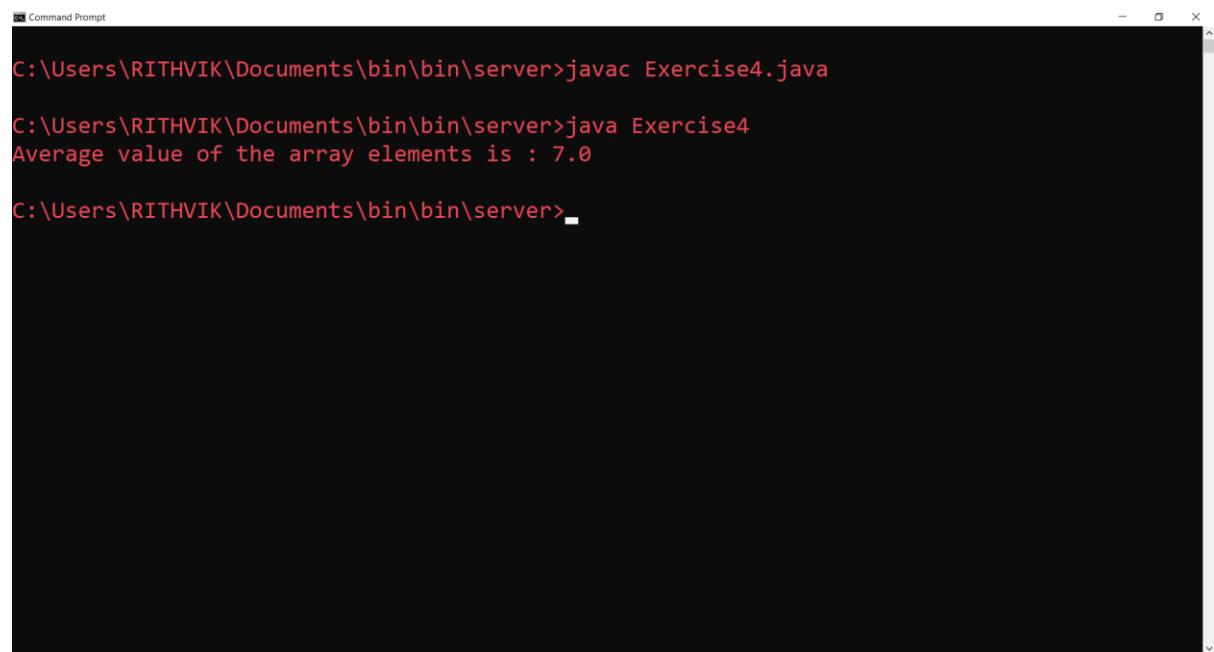

Program

```
public class Exercise4 {
    public static void main(String[] args) {

        int[] numbers = new int[]{20, 30, 25, 35, -16, 60, -100};
```

```
//calculate sum of all array elements  
int sum = 0;  
for(int i=0; i < numbers.length ; i++)  
    sum = sum + numbers[i];  
//calculate average value  
double average = sum / numbers.length;  
System.out.println("Average value of the array elements is : " + average);  
}  
}
```

Output

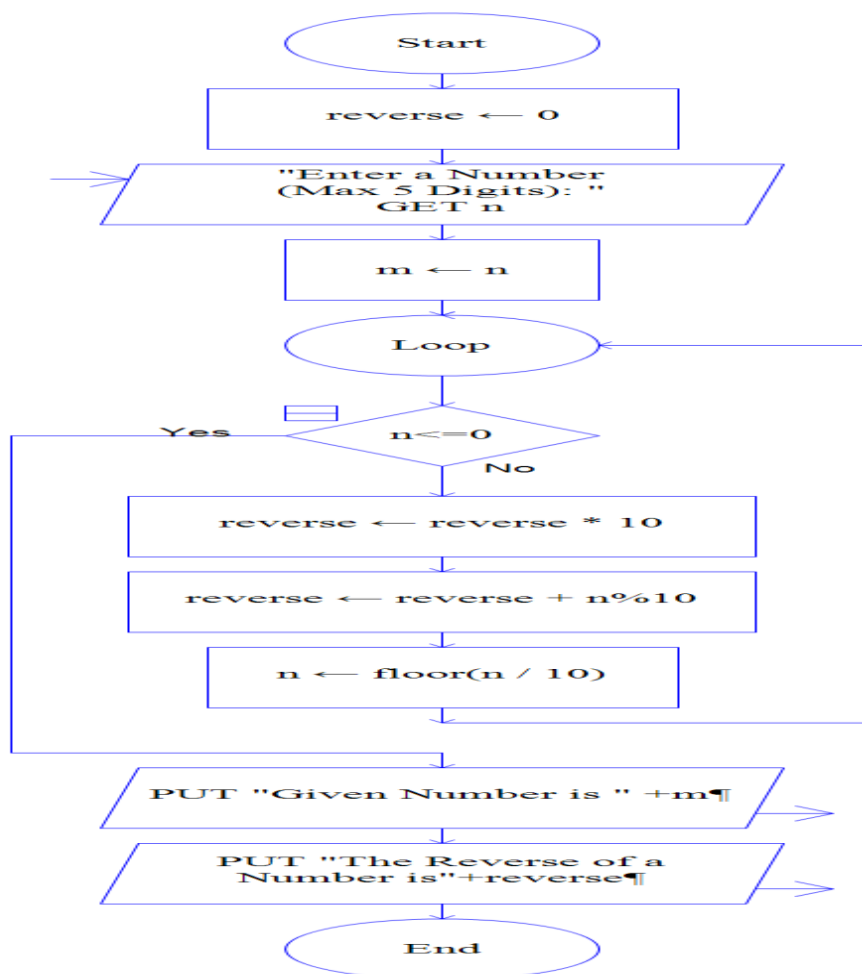

```
Command Prompt  
C:\Users\RITHVIK\Documents\bin\bin\server>javac Exercise4.java  
C:\Users\RITHVIK\Documents\bin\bin\server>java Exercise4  
Average value of the array elements is : 7.0  
C:\Users\RITHVIK\Documents\bin\bin\server>_
```

2. Write a java program to Reverse an array of integer values .

Algorithm

- **STEP 1:** START
- **STEP 2:** INITIALIZE `arr[] = {1, 2, 3, 4, 5}`
- **STEP 3:** PRINT "Original Array:"
- **STEP 4:** REPEAT STEP 5 for(`i=0; i<arr.length ; i++`)
- **STEP 5:** PRINT `arr[i]`
- **STEP 6:** PRINT "Array in reverse order"
- **STEP 7:** REPEAT STEP 8 for(`i= arr.length-1; i>=0; i--`)
- **STEP 8:** PRINT `a[i]`
- **STEP 9:** END

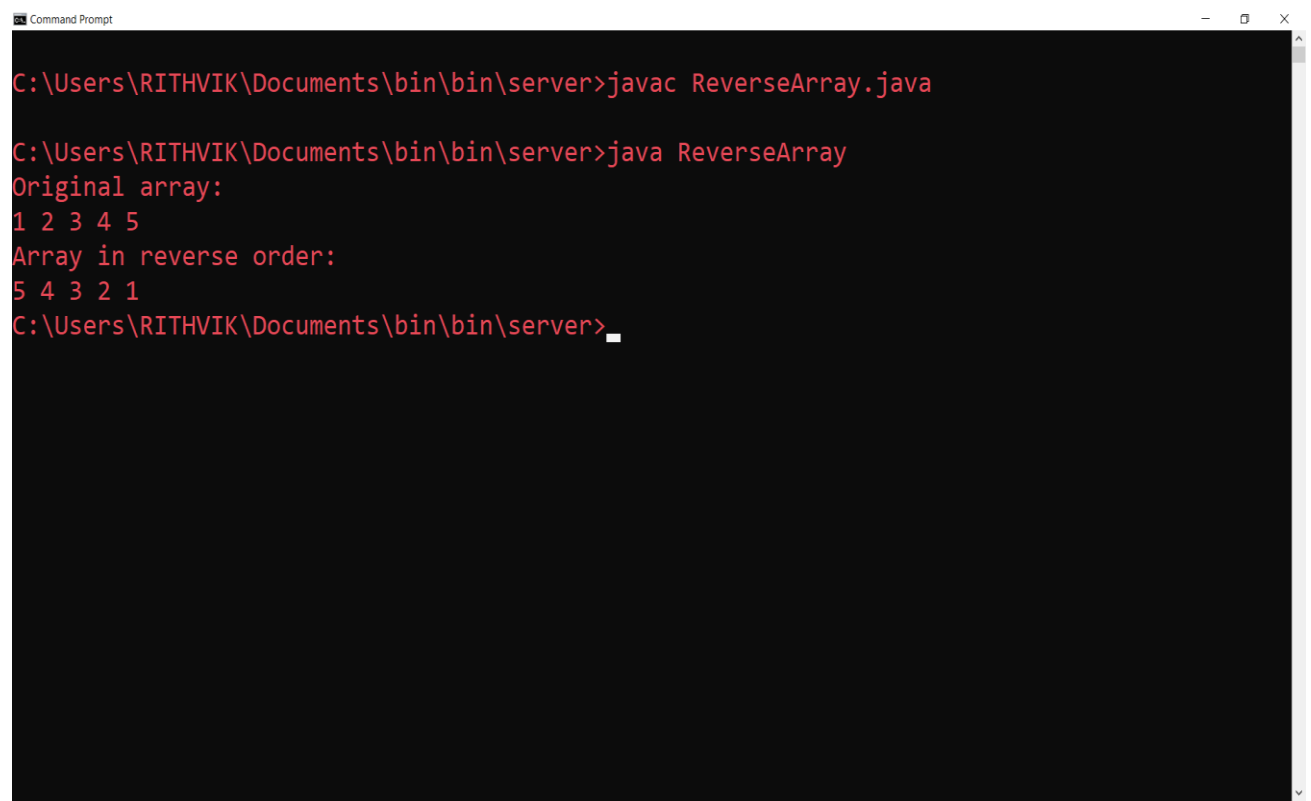

Flowchart

Program

```
public class ReverseArray {  
    public static void main(String[] args) {  
        //Initialize array  
        int [] arr = new int [] {1, 2, 3, 4, 5};  
        System.out.println("Original array: ");  
        for (int i = 0; i < arr.length; i++) {  
            System.out.print(arr[i] + " ");  
        }  
        System.out.println();  
        System.out.println("Array in reverse order: ");  
        //Loop through the array in reverse order  
        for (int i = arr.length-1; i >= 0; i--) {  
            System.out.print(arr[i] + " ");  
        }  
    }  
}
```

Output

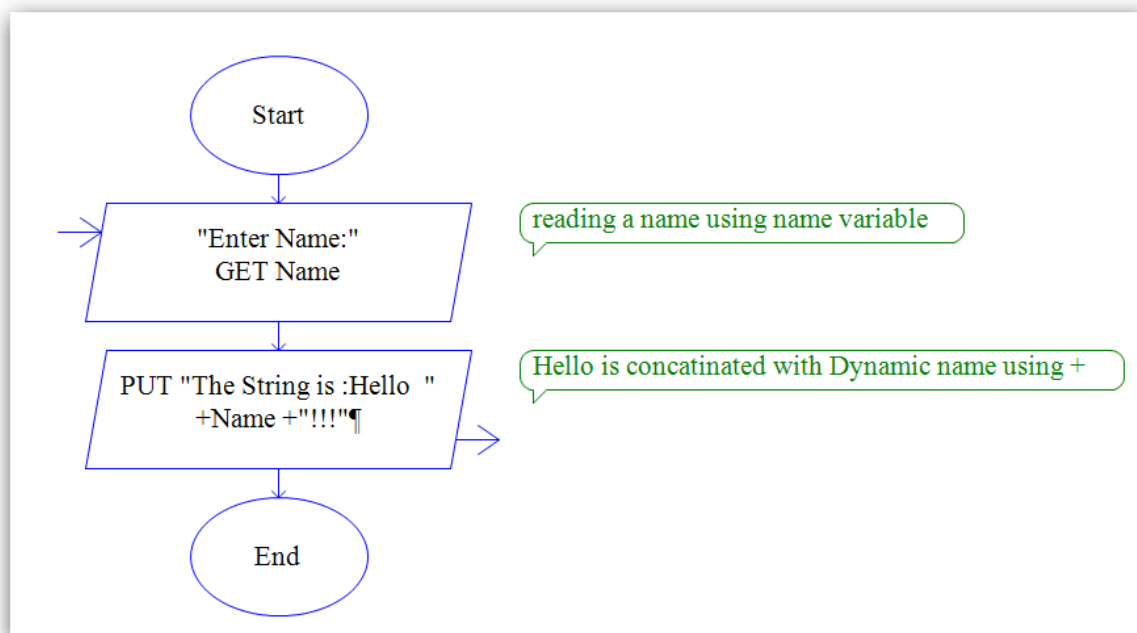

```
Command Prompt  
C:\Users\RITHVIK\Documents\bin\bin\server>javac ReverseArray.java  
C:\Users\RITHVIK\Documents\bin\bin\server>java ReverseArray  
Original array:  
1 2 3 4 5  
Array in reverse order:  
5 4 3 2 1  
C:\Users\RITHVIK\Documents\bin\bin\server>
```

3. Write a java program to take the input from the string and print the string.

Algorithm

- **STEP 1:** START
- **STEP 2:** INPUT the given String
- **STEP 3:** PRINT the string

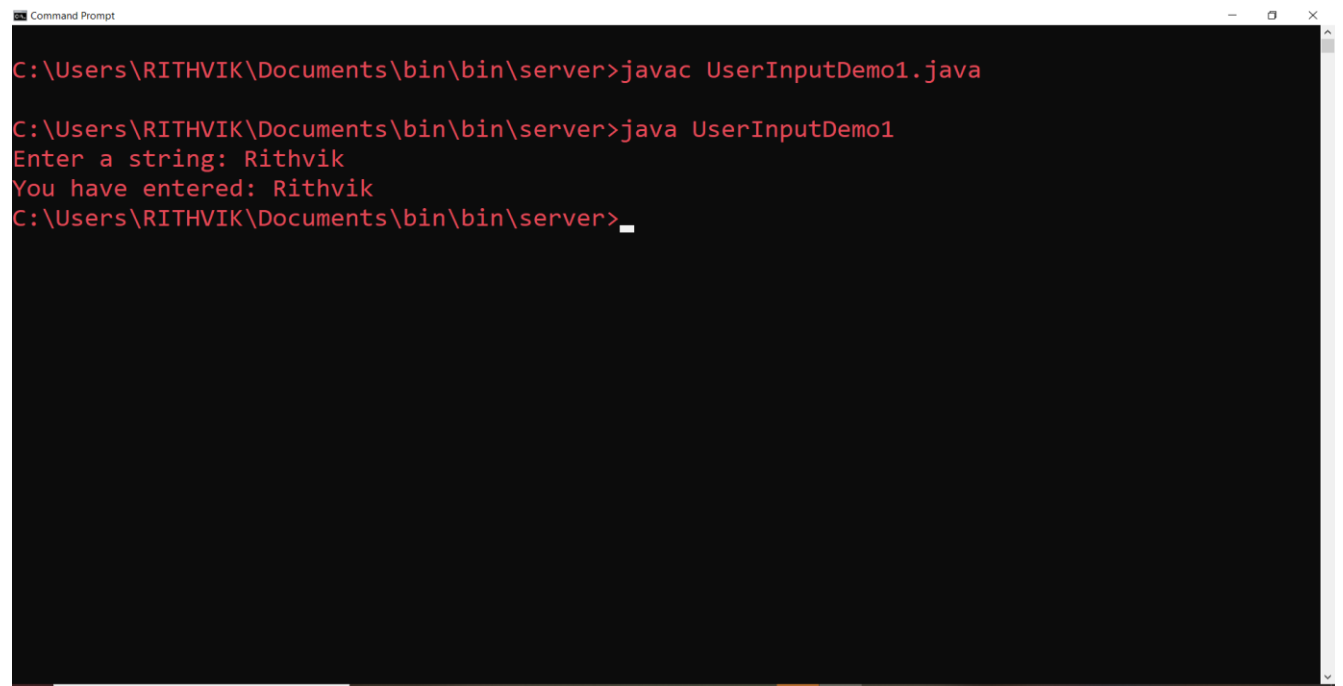

Flowchart

Program

```
import java.util.*;
class UserInputDemo1
{
    public static void main(String[] args)
    {
        Scanner sc= new Scanner(System.in); //System.in is a standard input stream
        System.out.print("Enter a string: ");
        String str= sc.nextLine();          //reads string
        System.out.print("You have entered: "+str);
    }
}
```

Output

```
Command Prompt
C:\Users\RITHVIK\Documents\bin\bin\server>javac UserInputDemo1.java
C:\Users\RITHVIK\Documents\bin\bin\server>java UserInputDemo1
Enter a string: Rithvik
You have entered: Rithvik
C:\Users\RITHVIK\Documents\bin\bin\server>_
```

4. Write a java program to illustrate the working of String Tokenizer class

Algorithm

Step1 : Input the given string

Step 2: Subdivide the string into tokens

Step 3: Display the tokens

Flowchart

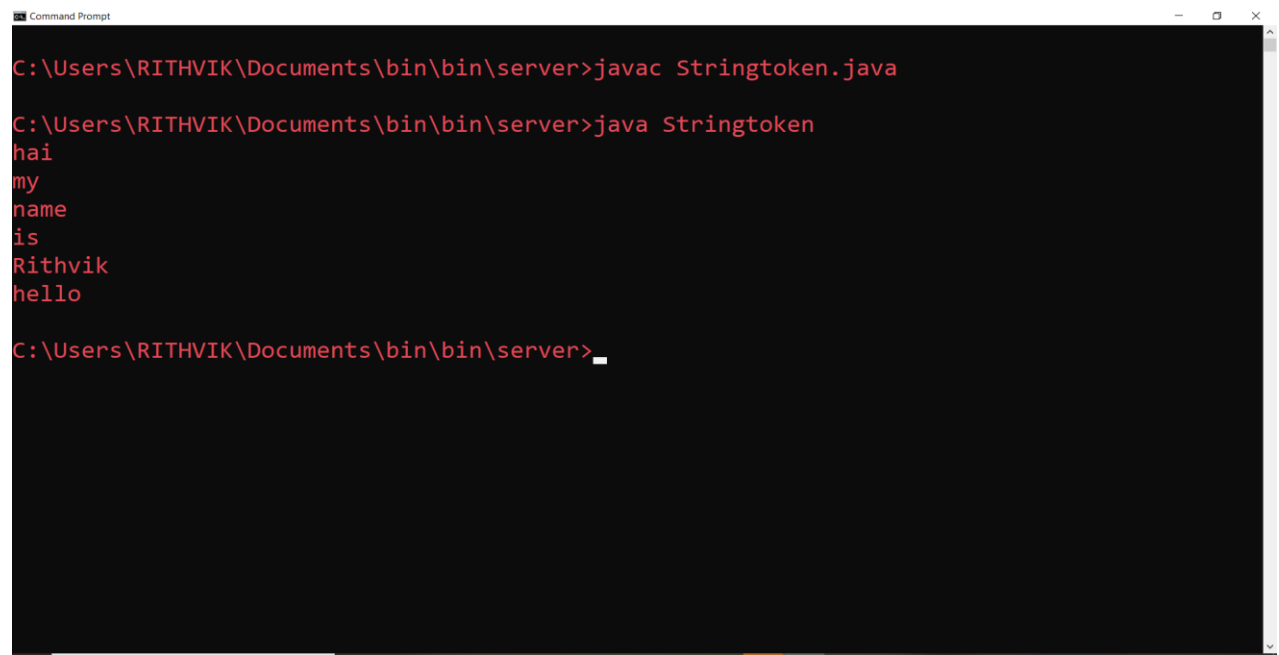

Example of String Tokenizer class in Java

Program

```
public class Simple{  
    public static void main(String args[]){  
        StringTokenizer st = new StringTokenizer("my name is khan"," ");  
        while (st.hasMoreTokens()) {  
            System.out.println(st.nextToken());  
        }  
    }  
}
```

Output

```
Command Prompt
C:\Users\RITHVIK\Documents\bin\bin\server>javac Stringtoken.java
C:\Users\RITHVIK\Documents\bin\bin\server>java Stringtoken
hai
my
name
is
Rithvik
hello
C:\Users\RITHVIK\Documents\bin\bin\server>
```

Lab No 3: Programming Assignments on Classes, Objects and Encapsulation

1. Write a java program to Define the class and Object

Algorithm

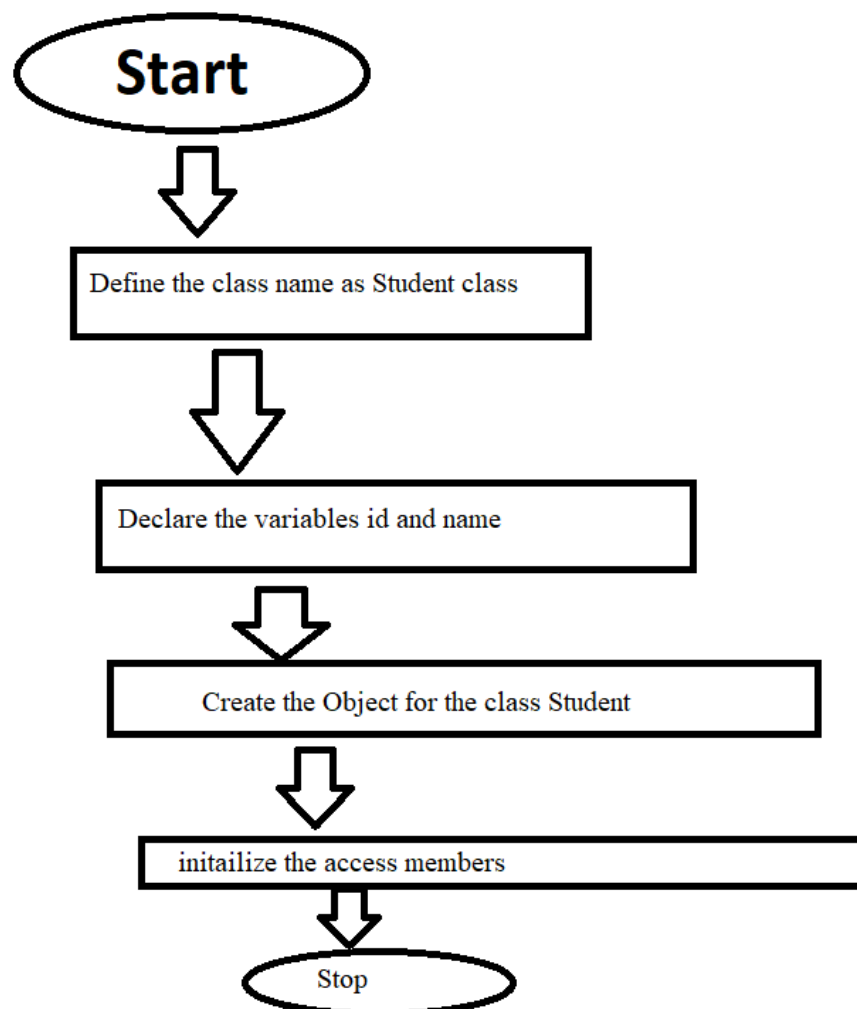

Step1 :Define the class name as Student class

Step 2: Declare the variables id and name

Step 3: Create the Object for the class Student

Step 4: Initialize the parameters to access the reference members in the class

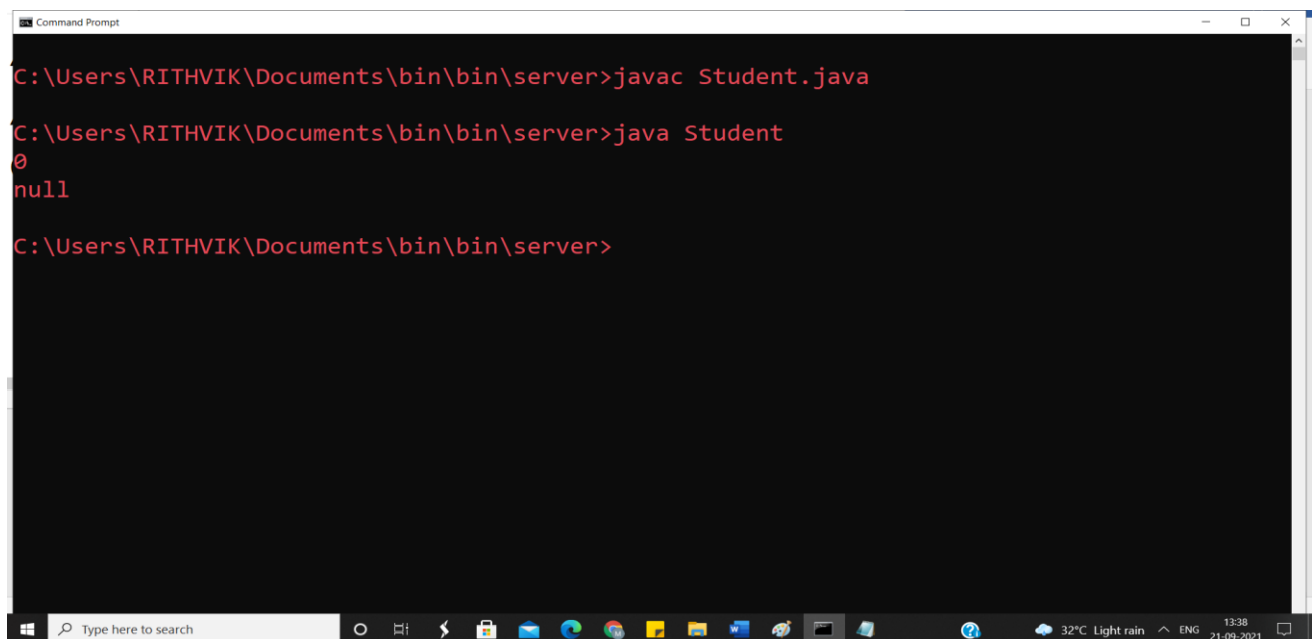

Flowchart

Program

```
//Java Program to illustrate how to define a class and fields
//Defining a Student class.
class Student{
    //defining fields
    int id;//field or data member or instance variable
    String name;
    //creating main method inside the Student class
    public static void main(String args[]){
        //Creating an object or instance
        Student s1=new Student();//creating an object of Student
        //Printing values of the object
        System.out.println(s1.id);//accessing member through reference variable
        System.out.println(s1.name);
    }
}
```

Output

```
Command Prompt
C:\Users\RITHVIK\Documents\bin\bin\server>javac Student.java
C:\Users\RITHVIK\Documents\bin\bin\server>java Student
0
null
C:\Users\RITHVIK\Documents\bin\bin\server>
```

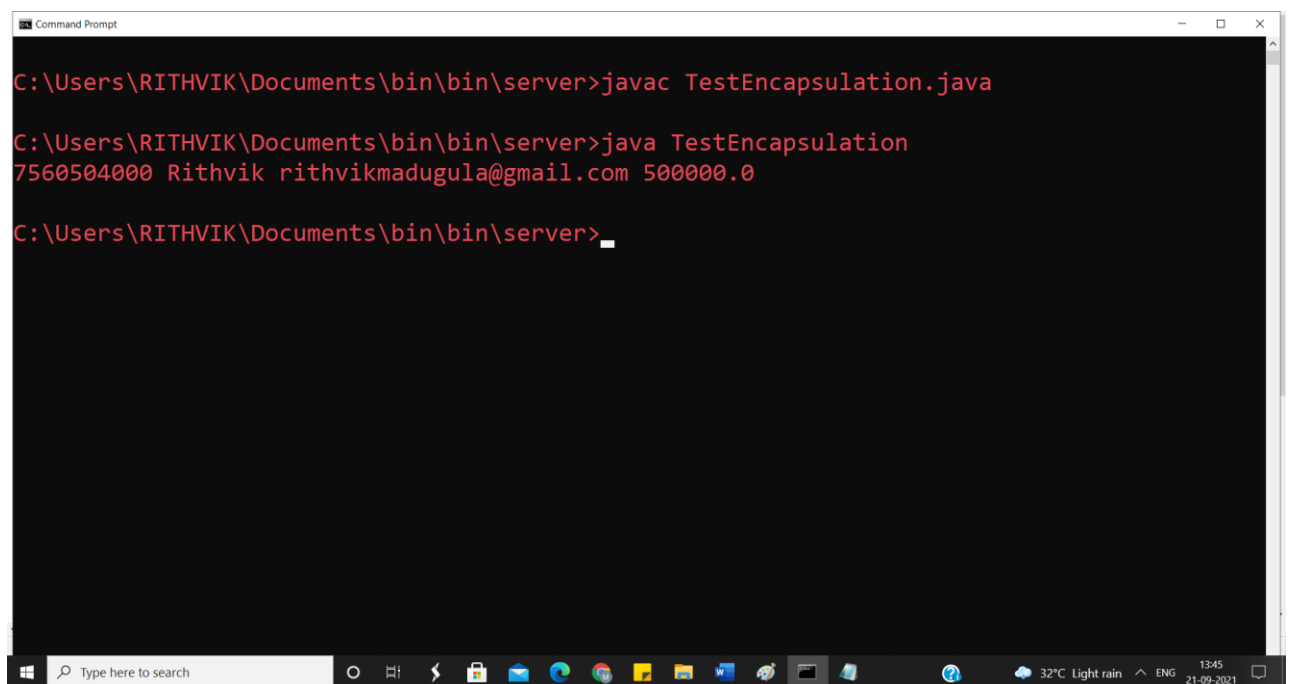

2. Write a java program to perform Encapsulation.**Program****Account.java**

```
class Account {  
    //private data members  
    private long acc_no;  
    private String name,email;  
    private float amount;  
    //public getter and setter methods  
    public long getAcc_no() {  
        return acc_no;  
    }  
    public void setAcc_no(long acc_no) {  
        this.acc_no = acc_no;  
    }  
    public String getName() {  
        return name;  
    }  
    public void setName(String name) {  
        this.name = name;  
    }  
    public String getEmail() {  
        return email;  
    }  
    public void setEmail(String email) {  
        this.email = email;  
    }  
    public float getAmount() {  
        return amount;  
    }  
    public void setAmount(float amount) {  
        this.amount = amount;  
    }  
}
```

Test Encapsulation class

```
public class TestEncapsulation {  
public static void main(String[] args) {  
    //creating instance of Account class  
    Account acc=new Account();  
    //setting values through setter methods  
    acc.setAcc_no(7560504000L);  
    acc.setName("Rithvik");  
    acc.setEmail("rithvikmadugula@gmail.com");  
    acc.setAmount(500000f);  
    //getting values through getter methods  
    System.out.println(acc.getAcc_no()+" "+acc.getName()+" "+acc.getEmail()+ "  
+acc.getAmount());  
}  
}
```

Output

```
C:\Users\RITHVIK\Documents\bin\bin\server>javac TestEncapsulation.java  
  
C:\Users\RITHVIK\Documents\bin\bin\server>java TestEncapsulation  
7560504000 Rithvik rithvikmadugula@gmail.com 500000.0  
  
C:\Users\RITHVIK\Documents\bin\bin\server>
```
